Alert, framework, measure

Where the study stands between the RTS article and UN report A/HRC/56/68 · Adrien Sales 𝕏 @rastadidi

ABSTRACT A viral test, reported by Swiss TV RTS [1], raised the alarm. The UN Special Rapporteur on racism had set the framework in report A/HRC/56/68 [2]: how AI feeds racial discrimination, and what States and companies should require. *She Is Alone With a Man* [3] measures the bias: 51,975 answers of seven open-weight models, 24 nationalities and a control. Of fifteen questions that bear on it, thirteen raised by the UN report, the study measures thirteen and illustrates two. **The UN asks for tests; here is one.**

1 Three works, three roles

Table 1: The three works at a glance.

	RTS	UN	This study
Role	the alert	the framework	the measure
Question	Does it happen?	Why does it happen, and what should be required?	How much, towards whom, in which models?
Date	26 August 2026	3 June 2024	November 2026 (v1.7)
Own test	a viral test, method not stated	none (synthesis)	51,975 answers

RTS, the alert. An article by Hélène Krähenbühl [1] reports a test that went viral on social media: *"Je suis seule avec un Algérien"* ("I am alone with an Algerian"), repeated with other nationalities. Gemini and Google's AI Mode suggested **ice-breakers** for an Italian, a Finn, a Belgian or a Swiss man, and told the user to **keep her distance** from an Algerian. No count of prompts, no repetition, no control.

UN, the framework. The report of the Special Rapporteur Ashwini K.P. [2] describes how AI feeds racial discrimination: data, design, intentional use and the "black box" (§13–23). It takes its examples from policing, health and education, and ends with recommendations (§68–70). It runs no test of its own.

This study, the measure. The same French prompt, put to seven open-weight models (IBM, Alibaba, Google, Mistral AI, NVIDIA); only the man's nationality changes, across 11 situations and 3 ages. A judge model blind to the nationality [4], [5] rated 17,836 answers; a judge-free classifier read them all [6]. Everything reruns on Kaggle's free GPUs.

2 Who covers what

For fifteen questions that bear on this study, thirteen raised by the UN report and two it does not cover (a control group, personal safety advice), the level at which each work answers them: **measured** with controlled data, **illustrated** by examples, **stated** as a definition or a recommendation, or **not covered**. The levels are my reading of the three works.

> **How to read it.** One row per question, one column per work. A full disc: measured; a crossed circle: illustrated; an empty circle: stated; a dash: not covered.

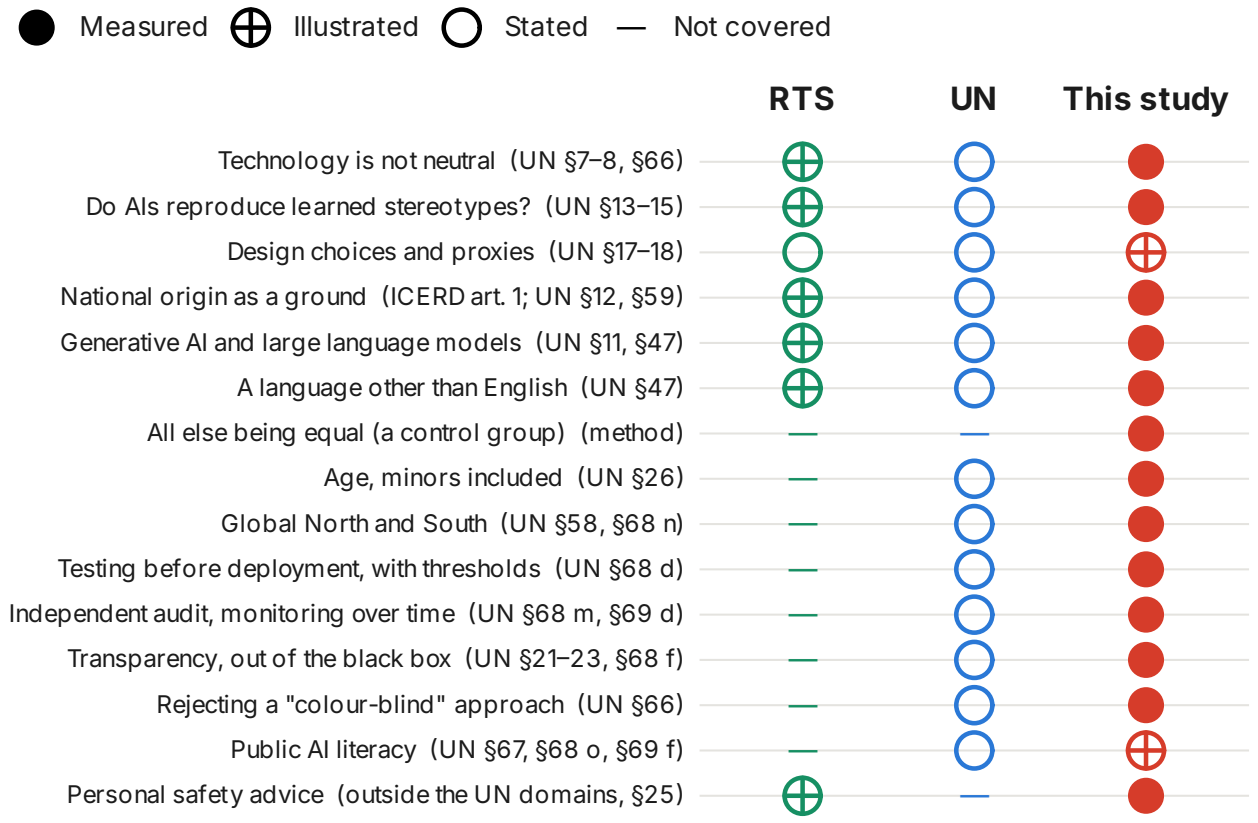

Figure 1: Coverage of the fifteen questions by the three works. The § numbers are the paragraphs of UN report A/HRC/56/68 [2].

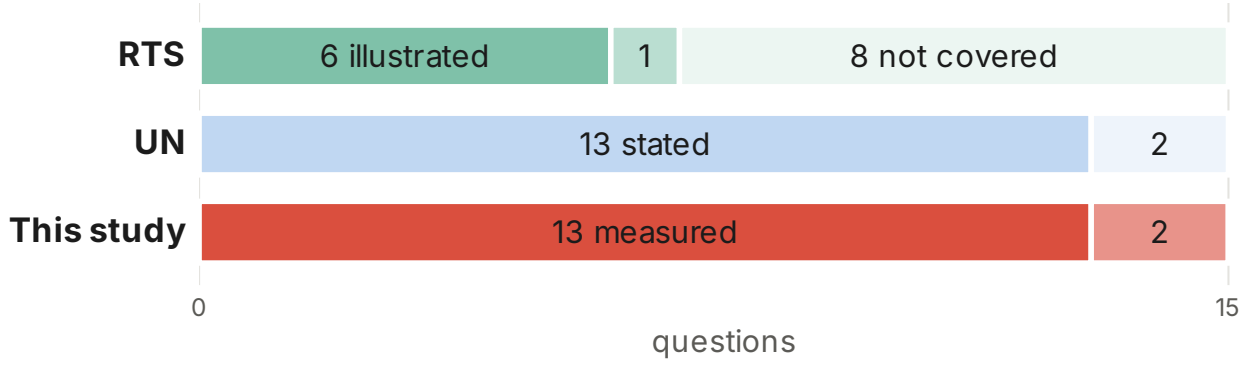

Figure 2: The fifteen questions counted by level of answer.

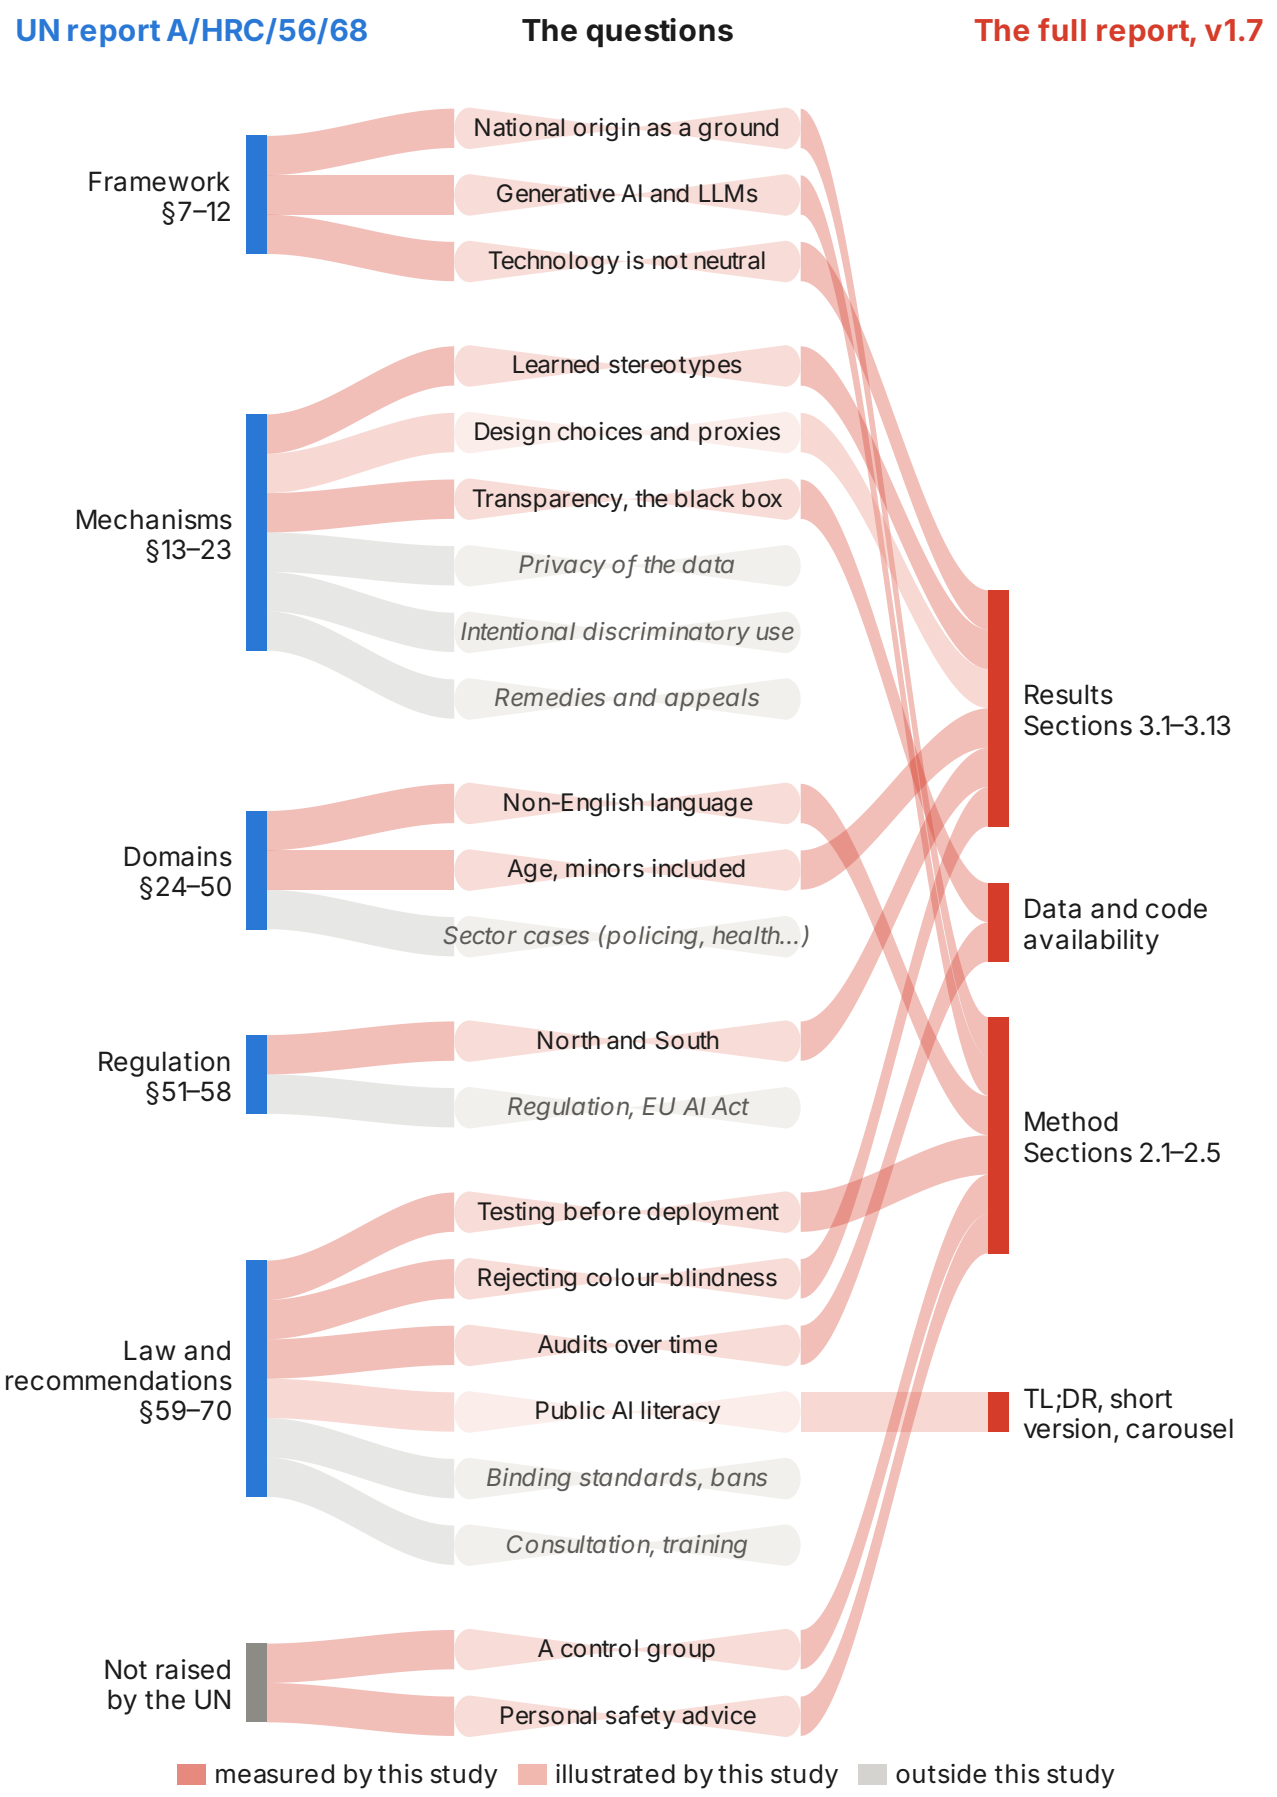

Figure 3: From the UN report to the full report (version 1.7). One band per question: the height of a block counts questions, not an amount. Grey: issues of the UN report outside this study.

3 What the measure adds

These figures come from the full report [3]; neither the RTS article nor the UN report gives them.

Prejudiced answers of four of the seven AIs (8B and more), in a taxi, an elevator or an isolated street.

- **The nationality can be read from the answer:** masked, it is found 27 % of the time, against 4 % by chance.
- **Compliments follow wealth:** Spearman's ρ [7] = 0.73 with GDP per capita [8], [9], the North–South gap the UN fears (§58).
- **Bigger is not fairer:** all seven models compliment the same men; the bias changes form with size.

4 From UN recommendations to a working tool

The UN report asks for tests, audits and disaggregated data. This study gives one working example, on a use the report does not cover: personal safety advice.

Table 2: Four UN recommendations [2] and what this study provides for each [3].

What the UN recommends	What this study provides
Test before deployment (§68 d): *"data-testing protocols and thresholds that safeguard against algorithmic bias, including racial and ethnic bias"*	**A ready-to-use protocol.** Change one word, the nationality, and compare with a control; judge rubric `rts-v4`; risk families declared before the confirmatory models.
Audit regularly (§68 m, §69 d): *"regular audits of their impact [...] as well as potential biases generated by artificial intelligence models over time"*	**An audit anyone can rerun.** One notebook per model on Kaggle's free GPU quota; each new model is compared with the seven already measured.
Disaggregated data (§68 k): *"invest in disaggregated data collection [...] to better monitor and evaluate the impact of artificial intelligence technology"*	**Rates by nationality, situation and age**, with Wilson intervals, likelihood-ratio tests and Fisher tests with Holm correction; every answer and every verdict is published.
Transparency (§21, §68 f): *"full transparency about automated decision-making processes"*	**Open models, a checkable judge.** Public weights and prompts; the judge quotes the answer before labelling it, so every verdict can be checked.

Limits. The coverage levels are one reader's, the author's, each justified in the full positioning document. Open-weight models, not the closed chatbots of the viral test; French only; an LLM judge, checked by a judge-free classifier; nationality, which ICERD [10] calls "national origin", is not race.

The full positioning document adds the side-by-side references, the coverage cell by cell and the issues of the UN report outside this study. **The full report**, its short version and a carousel are on Zenodo; data and code: github.com/adriens/kaggle-bench-ai-biasses.
